Moshe Praver, MD
COO, Columbia University

John Todaro
VP Business Development,
University of Pennsylvania

Ryan Cody
Technology Lead,
University of Michigan

The **fastest** way to a diagnosis...
Anytime. Anywhere.

What is MedCredits?

MedCredits harnesses the power of the blockchain, Ethereum smart contracts and smart phones to connect patients and doctors worldwide on a decentralized network. By decentralizing telemedicine, MedCredits is able to create a free-market system providing more affordable and efficient health care than currently available. The first software release *Hippocrates* is a user-friendly app connecting patients to board certified dermatologists for fast diagnoses at a fraction of the cost.

Market Opportunity

Telemedicine is expected to grow to a \$200 billion market by 2025. With hi-resolution cameras on every smart phone, teledermatology is rapidly expanding in this space. By removing the overhead associated with centralized services, such as compliance costs, centralized data storage, administrative fees and platform maintenance, MedCredits reduces the total cost of a dermatology consultation to between \$5 and \$10.

MEDX as a Protocol Token

MEDX is an ERC20 token used for both payment on the platform and physician verification on the network. In the first Token Curated Registry of Physicians, nodes on the network will verify physician licensing and board certification to ensure that only the highest quality physicians are granted access to the platform. In turn, these nodes will be rewarded in MEDX.
